

To install this update:

1) Make a backup of your current work with RCtool (This is very important and necessary if you wish to keep your work you have done so far using RCtool)

2) Move all files contained in this update to the RCtool work folder and/or subfolder therein by overwriting any identically named file with the one from this update

3) Launch RCtool and choose option “Updating” if you wish to restore from the backup the same state you had before the update and as saved in step 1. Otherwise choose option “First use” to start from scratch.
